ILAHIA COLLEGE OF ENGINEERINGG & TECHNOLOGY
Mulavoor,Muvattupuzha

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

CS 333 APPLICATION SOFTWARE DEVELOPMENT LAB MANUAL

VTH SEMESTER

LIST OF EXPERIMENTS

1. Data Definition, Table Creation, Constraints
2. Insert, Select Commands, Update and Delete Commands.
3. Nested Queries and Join Queries
4. Views
5. High level programming language extensions (Control structures, Procedures and Functions.
6. Triggers
7. Determination of Attribute Closure ,Candidate key, Functional dependency.
8. Checking serializability of a Schedule.
9. Dynamic Hashing.
10. Report Generation.
11. JDBC/ODBC Interface.

Exercise Number: 1

Title of the Exercise : DATA DEFINITION LANGUAGE (DDL) COMMANDS

Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To practice and implement data definition language commands and constraints.

a) Procedure for doing the experiment:

Step no.	Details of the step
1	**DDL COMMAND** It is used to communicate with database. DDL is used to: o Create an object o Alter the structure of an object o To drop the object created.
2	The commands used are: Create, Alter, Drop, Truncate
3	**INTEGRITY CONSTRAINT** An integrity constraint is a mechanism used by oracle to prevent invalid data entry into the table. It has enforcing the rules for the columns in a table. The types of the integrity constraints are: a) Domain Integrity b) Entity Integrity c) Referential Integrity
4	**a) Domain Integrity** This constraint sets a range and any violations that take place will prevent the user from performing the manipulation that caused the breach. It includes: **Not Null constraint:** While creating tables, by default the rows can have null value .the enforcement of not null constraint in a table ensure that the table contains values. **Principle of null values:** o Setting null value is appropriate when the actual value is unknown, or when a value would not be meaningful. o A null value is not equivalent to a value of zero. o A null value will always evaluate to null in any expression. o When a column name is defined as not null, that column becomes a mandatory i.e., the user has to enter data into it. o Not null Integrity constraint cannot be defined using the alter table command when the table contain rows.
5	**Check Constraint:** Check constraint can be defined to allow only a particular range of values .when the manipulation violates this constraint, the record will be rejected. Check condition cannot contain sub queries.

6	**b) Entity Integrity** Maintains uniqueness in a record. An entity represents a table and each row of a table represents an instance of that entity. To identify each row in a table uniquely we need to use this constraint. There are 2 entity constraints: **Unique key constraint** It is used to ensure that information in the column for each record is unique, as with telephone or drivers license numbers. It prevents the duplication of value with rows of a specified column in a set of column. A column defined with the constraint can allow null value. If unique key constraint is defined in more than one column i.e., combination of column cannot be specified. Maximum combination of columns that a composite unique key can contain is 16. **Primary Key Constraint** A primary key avoids duplication of rows and does not allow null values. It can be defined on one or more columns in a table and is used to uniquely identify each row in a table. These values should never be changed and should never be null. A table should have only one primary key. If a primary key constraint is assigned to more than one column or combination of column is said to be composite primary key, which can contain 16 columns.
7	**c) Referential Integrity** It enforces relationship between tables. To establish parent-child relationship between 2 tables having a common column definition, we make use of this constraint. To implement this, we should define the column in the parent table as primary key and same column in the child table as foreign key referring to the corresponding parent entry. **Foreign key** A column or combination of column included in the definition of referential integrity, which would refer to a referenced key. **Referenced key** It is a unique or primary key upon which is defined on a column belonging to the parent table.

b) SQL Commands:

CREATE TABLE

It is used to create a table

Syntax: Create table tablename (column_name1 data_ type constraints, column_name2 data_ type constraints …)

Example:

Create table Emp (EmpNo number(5), EName VarChar(15), Job Char(10) constraint un unique, DeptNo number(3) CONSTRAINT FKey2 REFERENCES DEPT(DeptNo));

Create table stud (sname varchar2(20) not null, rollno number(10) not null,dob date not null);

Rules:

1. Oracle reserved words cannot be used.
3. Underscore, numerals, letters are allowed but not blank space.
3. Maximum length for the table name is 30 characters.
4. 2 different tables should not have same name.
5. We should specify a unique column name.
6. We should specify proper data type along with width.
7. We can include “not null” condition when needed. By default it is „null“.

ALTER TABLE

Alter command is used to:
1. Add a new column.
2. Modify the existing column definition.
3. To include or drop integrity constraint.

Syntax: alter table tablename add/modify (attribute datatype(size));

Example:

1. Alter table emp add (phone_no char (20));
2. Alter table emp modify(phone_no number (10));
3. ALTER TABLE EMP ADD CONSTRAINT Pkey1 PRIMARY KEY (EmpNo);

DROP TABLE

It will delete the table structure provided the table should be empty.

Example:

drop table prog20; Here prog20 is table name

TRUNCATE TABLE

If there is no further use of records stored in a table and the structure has to be retained then the records alone can be deleted.

Syntax: TRUNCATE TABLE <TABLE NAME>;

Example: Truncate table stud;

DESC

This is used to view the structure of the table.

Example: desc emp;

Name	Null?	Type
EmpNo	NOT NULL	number(5)
EName		VarChar(15)
Job	NOT NULL	Char(10)
DeptNo	NOT NULL	number(3)
PHONE_NO		number (10)

DOMAIN INTEGRITY

Example: Create table cust(custid number(6) not null, name char(10));
Alter table cust modify (name not null);

CHECK CONSTRAINT

Example: Create table student (regno number (6), mark number (3) constraint b check (mark >=0 and mark <=100));
Alter table student add constraint b2 check (length(regno<=4));

ENTITY INTEGRITY

a) Unique key constraint

Example: Create table cust(custid number(6) constraint uni unique, name char(10));
Alter table cust add(constraint c unique(custid));

b) Primary Key Constraint

Example: Create table stud(regno number(6) constraint primary key, name char(20));

c) Queries:

Q1. Create a table called EMP with the following structure.

Name	Type
EMPNO	NUMBER(6)
ENAME	VARCHAR2(20)
JOB	VARCHAR2(10)
DEPTNO	NUMBER(3)
SAL	NUMBER(7,2)

Allow NULL for all columns except ename and job.

Solution:

1. Understand create table syntax.
2. Use the create table syntax to create the said tables.
3. Create primary key constraint for each table as understand from logical table structure.

Ans:

SQL> create table emp(empno number(6),ename varchar2(20)not null,job varchar2(10) not null, deptno number(3),sal number(7,2));

Table created.

Q2: Add a column experience to the emp table. experience numeric null allowed.

Solution:

1. Learn alter table syntax. 2. Define the new column and its data type.
3. Use the alter table syntax.

Ans:

SQL> alter table emp add(experience number(2));
Table altered.

Q3: Modify the column width of the job field of emp table.

Solution:

1. Use the alter table syntax. 2. Modify the column width and its data type.

Ans:

```
SQL>  alter table emp modify(job varchar2(12));
Table altered.
SQL> alter table emp modify(job varchar(13));
Table altered.
```

Q4: Create dept table with the following structure.

Name	**Type**
DEPTNO	**NUMBER(2)**
DNAME	**VARCHAR2(10)**
LOC	**VARCHAR2(10)**

Deptno as the primarykey

Solution:

1. Understand create table syntax. 2. Decide the name of the table.
3. Decide the name of each column and its data type.
4. Use the create table syntax to create the said tables.
5. Create primary key constraint for each table as understand from logical table structure.

Ans:

```
SQL> create table dept(deptno number(2) primary key,dname varchar2(10),loc
varchar2(10));
Table created.
```

Q5: create the emp1 table with ename and empno, add constraints to check the empno value while entering (i.e) empno > 100.

Solution:

1. Learn alter table syntax. 2. Define the new constraint [columns name type]
3. Use the alter table syntax for adding constraints.

Ans:

```
SQL> create table emp1(ename varchar2(10),empno number(6) constraint ch
check(empno>100));
Table created.
```

Q6: drop a column experience to the emp table.

Solution:

1. Learn alter table syntax. Use the alter table syntax to drop the column.

Ans:

```
SQL> alter table emp drop column experience;
Table altered.
```

Q7: Truncate the emp table and drop the dept table

Solution:

1. Learn drop, truncate table syntax.

Ans:

```
SQL> truncate table emp;
Table truncated.
SQL> drop table dept;
Table dropped.
```

Result:

Thus the data definition language commands was performed and implemented successfully.

QUESTIONS AND ANSWERS

1.Define the terms DDL:

Data base schema is specified by a set of definitions expressed by a special language called a data definition language.

2. What are the categories of SQL command?

SQL commands are divided in to the following categories:

Data Definition language

Data manipulation language

Data control language

Transaction Control Language

3.What is integrity constraint?

An integrity constraint is a mechanism used by oracle to prevent invalid data entry into the table. It has enforcing the rules for the columns in a table.

4.List the types of constraint.

- Domain Integrity
- Entity Integrity
- Referential Integrity

5.Primary Key Constraint

A primary key avoids duplication of rows and does not allow null values. It can be defined on one or more columns in a table and is used to uniquely identify each row in a table. These values should never be changed and should never be null.

6.Referential Integrity

It enforces relationship between tables. To establish parent-child relationship between 2 tables having a common column definition, we make use of this constraint. To implement this, we should define the column in the parent table as primary key and same column in the child table as foreign key referring to the corresponding parent entry.

Exercise Number: 2

Title of the Exercise : DATA MANIPULATION LANGUAGE (DML) COMMANDS
Date of the Exercise :

AIM OF THE EXPERIMENT

To study the various DML commands and implement them on the database.

a) Procedure for doing the experiment:

Step no.	Details of the step
1	**DML COMMAND** DML commands are the most frequently used SQL commands and is used to query and manipulate the existing database objects. Some of the commands are Insert, Select, Update, Delete
2	**Insert Command** This is used to add one or more rows to a table. The values are separated by commas and the data types char and date are enclosed in apostrophes. The values must be entered in the same order as they are defined.
3	**Select Commands** It is used to retrieve information from the table. it is generally referred to as querying the table. We can either display all columns in a table or only specify column from the table.
4	**Update Command** It is used to alter the column values in a table. A single column may be updated or more than one column could be updated.
5	**Delete command** After inserting row in a table we can also delete them if required. The delete command consists of a from clause followed by an optional where clause.

b) SQL Commands:

INSERT COMMAND

Inserting a single row into a table:

Syntax: insert into <table name> values (value list)
Example: insert into s values(„s3“,“sup3“,“blore“,10)

Inserting more than one record using a single insert commands:

Syntax: insert into <table name> values (&col1, &col2, ….)
Example: Insert into stud values(&reg, „&name“, &percentage);

Skipping the fields while inserting:

Insert into <tablename(coln names to which datas to b inserted)> values (list of values);
Other way is to give null while passing the values.

SELECT COMMANDS
Selects all rows from the table

Syntax: Select * from tablename;
Example: Select * from IT;

The retrieval of specific columns from a table:

It retrieves the specified columns from the table

Syntax: Select column_name1, …..,column_namen from table name;
Example: Select empno, empname from emp;

Elimination of duplicates from the select clause:

It prevents retriving the duplicated values .Distinct keyword is to be used.

Syntax: Select DISTINCT col1, col2 from table name;
Example: Select DISTINCT job from emp;

Select command with where clause:

To select specific rows from a table we include „where‟ clause in the select command. It can appear only after the „from‟ clause.

Syntax: Select column_name1, …..,column_namen from table name where condition;
Example: Select empno, empname from emp where sal>4000;

Select command with order by clause:

Syntax: Select column_name1, …..,column_namen from table name where condition order by colmnname;
Example: Select empno, empname from emp order by empno;

Select command to create a table:

Syntax: create table tablename as select * from existing_tablename;
Example: create table emp1 as select * from emp;

Select command to insert records:

Syntax: insert into tablename (select columns from existing_tablename);
Example: insert into emp1 (select * from emp);

UPDATE COMMAND

Syntax:update tablename set field=values where condition;
Example: Update emp set sal = 10000 where empno=135;

DELETE COMMAND

Syntax: Delete from table where conditions;
Example:delete from emp where empno=135;

c) Queries:

Q1: Insert a single record into dept table.

Solution:

1.Decide the data to add in dept.

2.Add to dept one row at a time using the insert into syntax.

Ans:

SQL> insert into dept values (1,'IT','ICET');

1 row created.

Q2: Insert more than a record into emp table using a single insert command.

Ans:

SQL> insert into emp values(&empno,'&ename','&job',&deptno,&sal);

Enter value for empno: 1
Enter value for ename: Aswathy
Enter value for job: AP
Enter value for deptno: 1
Enter value for sal: 30000
old 1: insert into emp values(&empno,'&ename','&job',&deptno,&sal)
new 1: insert into emp values(1,'Aswathy','AP',1,30000)

1 row created.

SQL>

Enter value for empno: 2
Enter value for ename: Arya
Enter value for job: AP
Enter value for deptno: 2
Enter value for sal: 40000

old 1: insert into emp values(&empno,'&ename','&job',&deptno,&sal)
new 1: insert into emp values(2,'Arya','AP',2,40000)

1 row created.

SQL>
Enter value for empno: 3
Enter value for ename: Milan
Enter value for job: Lecturer
Enter value for deptno: 1
Enter value for sal: 12000

old 1: insert into emp values(&empno,'&ename','&job',&deptno,&sal)
new 1: insert into emp values(3,'Milan','Lecturer',1,12000)

1 row created.

Q3: Update the emp table to set the salary of all employees to Rs15000/- who are working as Lecturer.

Ans:

```
SQL> select * from emp;
EMPNO   ENAME     JOB          DEPTNO    SAL
---------- -------------------- ------------- ---------- ----------
      1    Aswathy       AP            1         30000
      2    Arya          AP            2         40000
      3    Milan         Lecturer      1         12000

SQL> update emp set sal=15000 where job='Lecturer';
1 row updated.
SQL> select * from emp;

    EMPNO ENAME              JOB             DEPTNO        SAL
---------- -------------------- ------------- ---------- ----------
      1    Aswathy       AP            1         30000
      2    Arya          AP            2         40000
      3    Milan         Lecturer      1         15000
```

Q4: Create a pseudo table employee with the same structure as the table emp and insert rows into the table using select clauses.

Ans:

```
SQL> create table employee as select * from emp;

Table created.

SQL> desc employee;

 Name                      Null?                    Type
 ----------------------------------------- -------- ----------------------------
 EMPNO                                              NUMBER(6)
 ENAME                     NOT NULL                 VARCHAR2(20)
 JOB                       NOT NULL                 VARCHAR2(13)
 DEPTNO                                             NUMBER(3)
 SAL                                                NUMBER(7,2)
```

Q5: select employee name, job from the emp table

Ans:

```
SQL> select ename, job from emp;
ENAME             JOB
-------------------- -------------
Aswathy           AP
Arjun             AP
Milan             Lecturer

3 rows selected.
```

Q6: Delete only those who are working as Lecturer

Ans:

```
SQL> select * from emp;

     EMPNO ENAME   JOB            DEPTNO       SAL
---------- ------------------- ------------ ---------- ----------
         1 Aswathy       AP             1      30000
         2 Arya          AP             2      40000
         3 Milan         Lecturer       1      15000
         4 Neha          Lecturer       2      16000
         5 Tittu         AP             2      35000

5  rows selected.

SQL>  delete from emp where job='Lecturer';

2 rows deleted.
SQL> select * from emp;

     EMPNO ENAME    JOB            DEPTNO       SAL
---------- ------------------- ------------ ---------- ----------

         1 Aswathy       AP             1      30000
         2 Arya          AP             2      40000
         5 Tittu         AP             2      35000
```

Q7: List the records in the emp table orderby salary in ascending order.

Ans:

```
SQL> select * from emp order by sal;

     EMPNO  ENAME   JOB     DEPTNO       SAL
---------- ------------------- ------------ ---------- ----------
         2        Arya       AP             2      40000
         5       Tittu       AP             2      35000
         1     Aswathy       AP             1      30000
         4       Neha        Lecturer       2      16000
         3       Milan       Lecturer       1      15000
```

Q8: List the records in the emp table orderby salary in descending order.

Ans:

```
SQL> select * from emp order by sal desc;
     EMPNO ENAME      JOB     DEPTNO     SAL
---------- ------------------- ------------ ---------- ----------
         3       Milan       Lecturer       1      15000
         4       Neha         Lecturer      2      16000
         1     Aswathy         AP           1      30000
         5       Tittu         AP           2      35000
         2        Arya         AP           2      40000
```

Q9: Display only those employees whose deptno is 2.

Solution:

1. Use SELECT FROM WHERE syntax.

Ans:

SQL> select * from emp where deptno=2;

EMPNo	ENAME	JOB	DEPTNO	SAL
2	Arya	AP	2	40000
4	Neha	Lecturer	2	16000
5	Tittu	AP	2	35000

Q10: Display deptno from the table employee avoiding the duplicated values.

Solution:

1. Use SELECT FROM syntax.
2. Select should include distinct clause for the deptno.

Ans:

SQL> select distinct deptno from emp;

DEPTNO
1
2

d) Result:

Thus the DML commands using from where clause was performed successfully and executed.

QUESTIONS AND ANSWERS

1. **What is DML?**
   DML commands are the most frequently used SQL commands and is used to query and manipulate the existing database objects.
2. **What are DML command?**
   Some of the commands are Insert, Select, Update, Delet
3. **Give the general form of SQL Queries? Select**
   A1, A2……., An
   From R,1R2……., R
   m Where P
4. **What is the use of rename operation?**
   Rename operation is used to rename both relations and an attributes. It uses the as clause, taking the form: Old-name as new-name
5. **Define tuple variable?**
   Tuple variables are used for comparing two tuples in the same relation. The tuple variables are defined in the from clause by way of the as clause.
6. **Write the syntax to retrieve specific columns from a table:**

   Syntax: Select column_name1, …..,column_namen from table name;

Exercise Number: 3

Title of the Exercise : DATA CONTROL LANGUAGE (DCL), TRANSACTION CONTROL LANGUAGE (TCL) COMMANDS

Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To practice and implement data language commands (DCL, TCL).

a) Procedure for doing the experiment:

Step no.	Details of the step
1	**DCL COMMAND** The DCL language is used for controlling the access to the table and hence securing the database. DCL is used to provide certain privileges to a particular user. Privileges are rights to be allocated.
2	The privilege commands are namely, Grant and Revoke
3	The various privileges that can be granted or revoked are, Select Insert Delete Update References Execute All
4	**GRANT COMMAND:** It is used to create users and grant access to the database. It requires database administrator (DBA) privilege, except that a user can change their password. A user can grant access to their database objects to other users.
5	**REVOKE COMMAND:** Using this command , the DBA can revoke the granted database privileges from the user.
6	**TCL COMMAND** **COMMIT:** command is used to save the Records. **ROLL BACK:** command is used to undo the Records. **SAVE POINT** command is used to undo the Records in a particular transaction.

b) SQL Commands

DCL Commands

GRANT COMMAND

Grant < database_priv [database_priv…..] > to <user_name> identified by <password> [,<password…..];

Grant <object_priv> | All on <object> to <user | public> [With Grant Option];

REVOKE COMMAND

Revoke <database_priv> from <user [, user] >;

Revoke <object_priv> on <object> from < user | public >;

<database_priv> -- Specifies the system level priveleges to be granted to the users or roles. This includes create / alter / delete any object of the system.

<object_priv> -- Specifies the actions such as alter / delete / insert / references / execute / select / update for tables.

<all> -- Indicates all the priveleges.

[With Grant Option] – Allows the recipient user to give further grants on the objects.

The priveleges can be granted to different users by specifying their names or to all users by using the "Public" option.

TCL COMMANDS:
Syntax:
SAVEPOINT: SAVEPOINT <SAVE POINT NAME>;
ROLLBACK: ROLL BACK <SAVE POINT NAME>;
COMMIT: Commit;

c) Queries:
Tables Used:
Consider the following tables namely "DEPARTMENTS" and "EMPLOYEES"
Their schemas are as follows ,
Departments (dept _no , dept_ name, dept_location);
Employees (emp_id , emp_name , emp_salary);

Q1: Develop a query to grant all privileges of employees table into departments table
Ans:

```
SQL> Grant all on employees to departments;
Grant succeeded.
```

Q2: Develop a query to grant some privileges of employees table into departments table
Ans:

```
SQL> Grant select, update , insert on departments to departments with grant option;
Grant succeeded.
```

Q3: Develop a query to revoke all privileges of employees table from departments table
Ans:

```
SQL> Revoke all on employees from departments;
Revoke succeeded.
```

Q4: Develop a query to revoke some privileges of employees table from departments table
Ans:

```
SQL> Revoke select, update , insert on departments from departments;
Revoke succeeded.
```

Q5: Write a query to implement the save point
Ans:

```
SQL> SAVEPOINT S1;
Savepoint created.

SQL> select * from emp;
    EMPNO ENAME   JOB             DEPTNO SAL
---------- -------------------- ------------ ---------- ----------
         1       Anu          AP              1      10000
         2       Arjun        ASP             2      15000
         3       Megha        ASP             1      15000
         4       Karthik      Prof            2      30000

SQL> INSERT INTO EMP VALUES(5,'Ahalya','AP',1,10000);
1 row created.
```

SQL> select * from emp;

EMPNO	ENAME	JOB	DEPTNO	SAL
1	Anu	AP	1	10000
2	Arjun	ASP	2	15000
3	Megha	ASP	1	15000
4	Karthik	Prof	2	30000
5	Ahalya	AP	1	10000

Q6: Write a query to implement the rollback

Ans:

SQL> rollback s1;

SQL> select * from emp;

EMPNO	ENAME	JOB	DEPTNO	SAL
1	Anu	AP	1	10000
2	Arjun	ASP	2	15000
3	Megha	ASP	1	15000
4	Karthik	Prof	2	30000

Q6: Write a query to implement the commit

Ans:

SQL> COMMIT;

Commit complete.

Result: The DCL,TCL commands was performed successfully and executed.

QUESTIONS AND ANSWERS

1. **Define DCL?**

   The DCL language is used for controlling the access to the table and hence securing the database. DCL is used to provide certain privileges to a particular user. Privileges are rights to be allocated.

2. **List the DCL commands used in data bases**

   The privilege commands are namely, Grant and Revoke

3. **What type of privileges can be granted?**

   The various privileges that can be granted or revoked are,

   - ✓ Select
   - ✓ Insert
   - ✓ Delete
   - ✓ Update
   - ✓ References
   - ✓ Execute
   - ✓ All

4. **Write the syntax for grant command**

   Grant < database_priv [database_priv…..] > to <user_name> identified by <password> [,<password…..];

   Grant <object_priv> | All on <object> to <user | public> [With Grant Option];

5. **What are TCL commands?**

   *Commit *Rollback *save point

Exercise Number: 4

Title of the Exercise : IN BUILT FUNCTIONS

Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To perform nested Queries and joining Queries using DML command.

a) Procedure for doing the experiment:

Step no.	Details of the step
1	Function is a group of code that accepts zero or more arguments and both return one or more results. Both are used to manipulate individual data items. Operators differ from functional in that they follow the format of function name (arg..). An argument is a user defined variables or constants. Most operators accept at most 2 arguments while the structure of functions permit to accept 3 or more arguments. Function can be classifies into **single row function and group functions**.
2	**Single Row functions** A single row function or scalar function returns only one value for every row queries in table. Single row function can appear in a select command and can also be included in a where clause. The single row function can be broadly classified as, o Date Function o Numeric Function o Character Function o Conversion Function o Miscellaneous Function The example that follows mostly uses the symbol table "**dual**". It is a table, which is automatically created by oracle along with the data dictionary.
3	**Date Function** They operate on date values and produce outputs, which also belong to date data type except for months, between, date function returns a number.
4	**Group Functions** A group function returns a result based on group of rows

b) SQL Commands:

DATE FUNCTION

1. Add_month

This function returns a date after adding a specified date with specified number of months.

Syntax: Add_months(d,n); where d-date n-number of months

Example: Select add_months(sysdate,2) from dual;

2. last_day

It displays the last date of that month.

Syntax: last_day (d); where d-date

Example: Select last_day (,,1-jun-2009‟) from dual;

3. Months_between

It gives the difference in number of months between d1 & d2.

Syntax: month_between (d1,d2); where d1 & d2 -dates

Example: Select month_between (,,1-jun-2009‟,‟1-aug-2009‟) from dual;

4. next_day

It returns a day followed the specified date.

Syntax: next_day (d,day);

Example: Select next_day (sysdate,"wednesday") from dual

5. round

This function returns the date, which is rounded to the unit specified by the format model.

Syntax : round (d,[fmt]);

where d- date, [fmt] – optional. By default date will be rounded to the nearest day

Example: Select round (to_date(„1-jun-2009","dd-mm-yy"),"year") from dual;

Select round („1-jun-2009","year") from dual;

NUMERICAL FUNCTIONS

Command	Query	Output
Abs(n)	Select abs(-15) from dual;	15
Ceil(n)	Select ceil(55.67) from dual;	56
Exp(n)	Select exp(4) from dual;	54.59
Floor(n)	Select floor(100.2) from dual;	100
Power(m,n)	Select power(4,2) from dual;	16
Mod(m,n)	Select mod(10,3) from dual;	1
Round(m,n)	Select round(100.256,2) from dual;	100.26
Trunc(m,n)	Select trunc(100.256,2) from dual;	100.23
Sqrt(m,n)	Select sqrt(16) from dual;	4

CHARACTER FUNCTIONS

Command	Query	Output
initcap(char);	select initcap("hello") from dual;	Hello
lower (char);	select lower („HELLO") from dual;	hello
upper (char);	select upper („hello") from dual;	HELLO
ltrim (char,[set]);	select ltrim („cseit", „cse") from dual; select	it
rtrim (char,[set]);	rtrim („cseit", „it") from dual;	cse
replace (char,search string, replace string);	select replace(„jack and jue",„j",„bl") from dual;	black and blue
substr (char,m,n);	select substr („information", 3, 4) from dual;	Form

CONVERSION FUNCTION

1. to_char()

Syntax: to_char(d,[format]);

This function converts date to a value of varchar type in a form specified by date format.

If format is negelected then it converts date to varchar2 in the default date format.

Example: select to_char (sysdate, "dd-mm-yy") from dual;

2. to_date()

Syntax: to_date(d,[format]);

This function converts character to date data format specified in the form character.

Example: select to_date(„aug 15 2009","mm-dd-yy") from dual;

Miscellaneous Functions

1. uid – This function returns the integer value (id) corresponding to the user currently logged in.

Example: select uid from dual;

2. user – This function returns the logins user name.

Example: select user from dual;

3. nvl – The null value function is mainly used in the case where we want to consider null values as zero.

Syntax; nvl(exp1, exp2)

If exp1 is null, return exp2. If exp1 is not null, return exp1.

Example: select custid, shipdate, nvl(total,0) from order;

4. vsize: It returns the number of bytes in expression.

Example: select vsize(„tech‟) from dual;

GROUP FUNCTIONS

A group function returns a result based on group of rows.

1. avg - Example: select avg (total) from student;

2. max - Example: select max (percentagel) from student;

2.min - Example: select min (marksl) from student;

4. sum - Example: select sum(price) from product;

COUNT FUNCTION

In order to count the number of rows, count function is used.

1. count(*) – It counts all, inclusive of duplicates and nulls.

Example: select count(*) from student;

2. count(col_name)– It avoids null value.

Example: select count(total) from order;

2. count(distinct col_name) – It avoids the repeated and null values.

Example: select count(distinct ordid) from order;

GROUP BY CLAUSE

This allows us to use simultaneous column name and group functions.

Example: Select max(percentage), deptname from student group by deptname;

HAVING CLAUSE

This is used to specify conditions on rows retrieved by using group by clause.

Example: Select max(percentage), deptname from student group by deptname having count(*)>=50;

SPECIAL OPERATORS:

In / not in – used to select a equi from a specific set of values

Any - used to compare with a specific set of values

Between / not between – used to find between the ranges

Like / not like – used to do the pattern matching

c) Queries:

Q1: **Display all the details of the records whose employee name starts with _A‟.**

Solution:

1. Use SELECT FROM WHERE syntax. 2. select should include all in the given format.

3. from should include employee 4. where should include condition on empname like „A%‟.

Ans:

```
SQL> select * from emp where ename like 'A%';
     EMPNO ENAME      JOB   DEPTNO       SAL
---------- ---------- ---------- ---------- ----------
         2 Arjun      ASP        2          15000
         5 Ahalya     AP         1          10000
```

Q2: Display all the details of the records whose employee name does not starts with _A‟.

Ans:

SQL> select * from emp where ename not like 'A%';

EMPNO	ENAME	JOB	DEPTNO	SAL
1	Anu	AP	1	10000
3	Megha	ASP	1	15000
4	Karthik	Prof	2	30000

Q3: Display the rows whose salary ranges from 15000 to 30000.

Ans:

```
SQL> select * from emp where sal between 15000 and 30000;
```

EMPNO	ENAME	JOB	DEPTNO	SAL
2	Arjun	ASP	2	15000
3	Megha	ASP	1	15000
4	Karthik	Prof	2	30000

Q4: Calculate the total and average salary amount of the emp table.

Ans:

```
SQL> select sum(sal),avg(sal) from emp;
```

SUM(SAL)	AVG(SAL)
80000	16000

Q5: **Count the total records in the emp table.**

Ans:

```
SQL>select * from emp;
```

EMPNO	ENAME	JOB	DEPTNO	SAL
1	Anu	AP	1	10000
2	Arjun	ASP	2	15000
3	Megha	ASP	1	15000
4	Karthik	Prof	2	30000
5	Ahalya	AP	1	10000

```
SQL> select count(*) from emp;
```

COUNT(*)
5

Q6: Determine the max and min salary and rename the column as max_salary and min_salary.

Solution:

1. Use the MIN & MAX aggregate function in select clause.
2. Rename the column as min_sal & max_sal.

Ans:

```
SQL> select max(sal) as max_salary, min(sal) as min_salary from emp;
```

MAX_SALARY	MIN_SALARY
30000	10000

Q7: Display the month between ―1-jun-10‖ and 1-aug-10 in full.

Ans:

```
SQL>Select month_between („1-jun-2010‟,‟1-aug-2010‟) from dual;
```

Q8: Display the last day of that month in ―05-Oct-09‖.

Ans:

```
SQL> Select last_day ('1-jun-2009') from dual;
LAST_DAY(
---------
30-JUN-09
```

Q9: Find how many job titles are available in employee table.

Solution:

1. Use select from clause.
2. Use count function to get the result.

Ans:

```
SQL> select count(job) from emp;
COUNT(JOB)
----------
         4
SQL> select count(distinct job) from emp;
COUNT(DISTINCTJOB)
------------------
                 2
```

Q10: What is the difference between maximum and minimum salaries of employees in the organization?

Solution:

1. Use select from clause.
2. Use function max(),min() and find the difference between them to get the result.

Ans:

```
SQL> select max(sal), min(sal) from emp;
MAX(SAL)   MIN(SAL)
---------- ----------
    20000      10000
```

d) Result:

Thus the nested Queries and join Queries was performed successfully and executed.

QUESTIONS AND ANSWERS

1. **Define function?**

   Function is a group of code that accepts zero or more arguments and both return one or more results. Both are used to manipulate individual data items.

2. **Write the two types of functions**

   i. Single row functions

   ii. Group functions

3. **What are single row functions?**

   A single row function or scalar function returns only one value for every row queries in table. Single row function can appear in a select command and can also be included in a where clause. The single row function can be broadly classified as,

   o Date Function o Numeric Function

   o Character Function o Conversion Function

   o Miscellaneous Function

4. **List some character funcitons**

   initcap(char);

   lower (char);

   upper (char);

   ltrim (char,[set]); rtrim (char,[set]);

Exercise Number: 5

Title of the Exercise : NESTED QUERIES AND JOIN QUERIES

Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To perform nested Queries and joining Queries using DML command.

a) Procedure for doing the experiment:

Step no.	Details of the step
1	**Nested Queries:** Nesting of queries one within another is known as a nested queries. **Sub queries** The query within another is known as a sub query. A statement containing sub query is called parent statement. The rows returned by sub query are used by the parent statement.
2	**Types** **1. Sub queries that return several values** Sub queries can also return more than one value. Such results should be made use along with the operators in and any. **2. Multiple queries** Here more than one sub query is used. These multiple sub queries are combined by means of „and" & „or" keywords **3. Correlated sub query** A sub query is evaluated once for the entire parent statement whereas a correlated Sub query is evaluated once per row processed by the parent statement.
3	**Relating Data through Join Concept** The purpose of a join concept is to combine data spread across tables. A join is actually performed by the „where" clause which combines specified rows of tables. Syntax; select columns from table1, table2 where logical expression; **Types of Joins** 1. Simple Join 2. Self Join 3. Outer Join 4. Inner Join
4	1. Simple Join **a) Equi-join:** A join, which is based on equalities, is called equi-join. **b) Non Equi-join:** It specifies the relationship between **Table Aliases** Table aliases are used to make multiple table queries shorted and more readable. We give an alias name to the table in the „from" clause and use it instead of the name throughout the query.
5	**Self join:** Joining of a table to itself is known as self-join. It joins one row in a table to another. It can compare each row of the table to itself and also with other rows of the same table.
6	**Outer Join:** It extends the result of a simple join. An outer join returns all the rows returned by simple join as well as those rows from one table that do not match any row from the table. The symbol (+) represents outer join. **Inner join:** Inner join returns the matching rows from the tables that are being joined

b) SQL Commands:

Nested Queries:

Example: select ename, eno, address where salary >(select salary from employee where ename ="jones");

1.Subqueries that return several values

Example: select ename, eno, from employee where salary <any (select salary from employee where deptno =10");

3.Correlated subquery

Example: select * from emp x where x.salary > (select avg(salary) from emp where deptno =x.deptno);

Simple Join

a) Equi-join

Example: select * from item, cust where item.id=cust.id;

b) Non Equi-join

Example: select * from item, cust where item.id<cust.id;

Self join

Example: select * from emp x ,emp y where x.salary >= (select avg(salary) from x.emp where x. deptno =y.deptno);

Outer Join

Example: select ename, job, dname from emp, dept where emp.deptno (+) = dept.deptno;

d) Queries:

Q1: Display all employee names and salary whose salary is greater than minimum salary of the company and job title starts with _M'.

Solution:

1. Use select from clause.
2. Use like operator to match job and in select clause to get the result.

Ans:

```
SQL> select ename,sal from emp where sal>(select min(sal) from emp where job like 'A%');
ENAME                SAL
-------------------- ----------
Arjun                 12000
Megha                 20000
Karthik               15000
```

Q2: Issue a query to find all the employees who work in the same job as Arjun.

Ans:

```
SQL> select * from emp;
    EMPNO  ENAME   JOB      DEPTNO   SAL
---------- -------------------- ---------- ---------- ----------
         1        Anu          AP         1          10000
         2       Arjun         ASP        2          12000
         3       Megha         ASP        2          20000
         4      Karthik         AP        1          15000
SQL> select ename from emp where job=(select job from emp where ename='Arjun');
ENAME
--------------
Arjun
Megha
```

Q3: Issue a query to display information about employees who earn more than any employee in dept 1.
Ans:

```
SQL> select * from emp where sal>(select max(sal) from emp where empno=1);

    EMPNO   ENAME   JOB    DEPTNO    SAL
---------- ------------------- ---------- ---------- ----------
         2       Arjun         ASP       2           12000
         3       Megha        ASP       2           20000
         4       Karthik       AP        1           15000
```

JOINS

Tables used

```
SQL> select * from emp;

    EMPNO ENAME   JOB      DEPTNO    SAL
---------- ------------------- ---------- ---------- ----------
         1       Anu           AP            1      10000
         2       Arjun         ASP           2      12000
         3       Megha          A            2      20000
         4   Karthik           AP            1      15000

SQL> select * from dept;

   DEPTNO DNAME         LOC
---------- -------------- -------------
         1   ACCOUNTING    NEW YORK
         2   RESEARCH       DALLAS
        30   SALES          CHICAGO
        40   OPERATIONS     BOSTON
```

EQUI-JOIN

Q4: Display the employee details, departments that the departments are same in both the emp and dept.
Solution:
1. Use select from clause. 2. Use equi join in select clause to get the result.
Ans:

```
SQL> select * from emp,dept where emp.deptno=dept.deptno;
  EMPNO ENAME      JOB    DEPTNO   SAL     DEPTNO   DNAME         LOC
---------- ------------------ ---------- ---------- ----------  -------------- -------------
         1       Anu          AP            1      10000         1  ACCOUNTING     NEW YORK
         2       Arjun        ASP           2       12000        2   RESEARCH       DALLAS
         3       Megha        ASP           2       20000        2  RESEARCH       DALLAS
         4       Karthik      AP            1       15000        1  ACCOUNTING     NEW YORK
```

NON-EQUIJOIN

Q5: Display the employee details, departments that the departments are not same in both the emp and dept.
Solution:
1.Use select from clause. 2. Use non equi join in select clause to get the result.

Ans:

SQL> select * from emp,dept where emp.deptno!=dept.deptno;

EMPNO	ENAME	JOB	DEPTNO	SAL	DEPTNO	DNAME	LOC
2	Arjun	ASP	2	12000	1	ACCOUNTING	NEW YORK
3	Megha	ASP	2	20000	1	ACCOUNTING	NEW YORK
1	Anu	AP	1	10000	2	RESEARCH	DALLAS

EMPNO	ENAME	JOB	DEPTNO	SAL	DEPTNO	DNAME	LOC
4	Karthik	AP	1	15000	2	RESEARCH	DALLAS
1	Anu	AP	1	10000	30	SALES	CHICAGO
2	Arjun	ASP	2	12000	30	SALES	CHICAGO
2	Arjun	ASP	2	12000	40	OPERATIONS	BOSTON
3	Megha	ASP	2	20000	40	OPERATIONS	BOSTON
4	Karthik	AP	1	15000	40	OPERATIONS	BOSTON

6 rows selected.

LEFTOUT-JOIN

Tables used

SQL> select * from stud1;

Regno	Name	Mark2	Mark3	Result
101	John	89	80	pass
102	Raja	70	80	pass
103	Sharin	70	90	pass

SQL> select * from stud2;

NAME	GRA
john	s
raj	s
sam	a
sharin	a

Q6: Display the Student name and grade by implementing a left outer join.

Ans: SQL> select stud1.name,grade from stud1 left outer join stud2 on stud1.name=stud2.name;

Name	Gra
john	s
raj	s
sam	a
sharin	a
smith	null

RIGHTOUTER-JOIN

Q7: Display the Student name, register no, and result by implementing a right outer join.

Ans:

```
SQL> select stud1.name, regno, result from stud1 right outer join stud2 on stud1.name =
stud2.name;
Name           Regno  Result
---------- ---------- -------------------------
john           101          pass
raj             102          pass
sam            103          pass
sharin         104          pass
  Rollno Name    Mark1 Mark          Total
---------- ---------- ---------- ---------- ----------
       1 sindu          90       95       185
       2 arul           90       90       180
```

FULLOUTER-JOIN

Q8: Display the Student name register no by implementing a full outer join.

Ans:

```
SQL> select stud1.name, regno from stud1 full outer join stud2 on (stud1.name= stud2.name);
Name           Regno
---------- ----------
john           101
raj             102
sam            103
sharin         104
```

SELFJOIN

Q9: Write a query to display their employee names

Ans:

```
SQL> select distinct ename from emp x, dept y where x.deptno=y.deptno;
ENAME
--------------------
Arjun
Megha
Karthik
Anu
```

Q10: Display the details of those who draw the salary greater than the average salary.

Ans:

```
SQL> select distinct * from emp x where x.sal >= (select avg(sal) from emp);
    EMPNO ENAME      JOB          DEPTNO       SAL
---------- -------------------- ---------- ---------- ----------
         3 Anu              ASP           2      20000
         4 Karthik          AP            1      15000
        11 kavitha          designer      12      17000
```

e) Result:

Thus the nested Queries and join Queries was performed successfully and executed.

QUESTIONS AND ANSWERS

1. **What is the use of sub Queries?**

   A sub Queries is a select-from-where expression that is nested with in another Queries. A common use of sub Queries is to perform tests for set membership, make set comparisons, and determine set cardinality

Exercise Number: 6

Title of the Exercise : SET OPERATORS
Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To perform set operations using DML Commands.

a) Procedure for doing the experiment:

Step no.	Details of the step
1	**Set Operators:** The Set operator combines the result of 2 queries into a single result. The following are the operators: · Union · Union all · Intersect · Minus
2	**The rules to which the set operators are strictly adhere to :** · The queries which are related by the set operators should have a same number of column and column definition. · Such query should not contain a type of long. · Labels under which the result is displayed are those from the first select statement.

b) SQL commands:

Union: Returns all distinct rows selected by both the queries

Syntax:
Query1 Union Query2;

Union all: Returns all rows selected by either query including the duplicates.

Syntax:
Query1 Union all Query2;

Intersect: Returns rows selected that are common to both queries.

Syntax:
Query1 Intersect Query2;

Minus: Returns all distinct rows selected by the first query and are not by the second

Syntax:
Query1 minus Query2;

c) Queries:

Q1: Display all the dept numbers available with the dept and emp tables avoiding duplicates.

Solution:
1. Use select from clause. 2. Use union select clause to get the result.

Ans:

SQL> select deptno from emp union select deptno from dept;

```
   DEPTNO
----------
         1
         2
        12
        30
        40
```

Q2: **Display all the dept numbers available with the dept and emp tables.**
Solution:
1. Use select from clause. 2. Use union all in select clause to get the result.
Ans:

```
SQL>  select deptno from emp union all select deptno from dept;

   DEPTNO
----------
         1
         2
         2
         1
        12
         1
         2
        30
        40
9 rows selected.
```

Q3: **Display all the dept numbers available in emp and not in dept tables and vice versa.**
Solution:
1. Use select from clause.
2. Use minus in select clause to get the result.
Ans:

```
SQL> select deptno from emp minus select deptno from dept;

   DEPTNO
----------
        12
SQL> select deptno from dept minus select deptno from emp;
   DEPTNO
----------
        30
        40
```

d) Result:

Thus the set operations using DML Commands was successfully performed and executed.

QUESTIONS AND ANSWERS

1. **List the set operations of SQL?**
   1)Union 2)Intersect operation 3)The except operation(minus)
2. **Which command returns all distinct rows selected by both the queries?**
   Union

Exercise Number: 7

Title of the Exercise : VIEWS
Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To create and manipulate various database objects of the Table using views

a) Procedure for doing the experiment:

Step no.	Details of the step
1	**Views:** A view is the tailored presentation of data contained in one or more table and can also be said as restricted view to the data‟s in the tables. A view is a “virtual table” or a “stored query” which takes the output of a query and treats it as a table. The table upon which a view is created is called as base table.
2	A view is a logical table based on a table or another view. A view contains no data of its own but is like a window through which data from tables can be viewed or changed. The tables on which a view is based are called base tables. The view is stored as a SELECT statement in the data dictionary
3	**Advantages of a view:** a. Additional level of table security. b. Hides data complexity. c. Simplifies the usage by combining multiple tables into a single table. d. Provides data‟s in different perspective.
4	**Types of view:** Horizontal -> enforced by where cause Vertical -> enforced by selecting the required columns

b) SQL Commands

Creating and dropping view:

Syntax:

Create [or replace] view <view name> [column alias names] as <query> [with <options> conditions];

Drop view <view name>;

Example:

Create or replace view empview as select * from emp;

Drop view empview;

c) Queries:

Tables used:

```
SQL> select * from emp;
    EMPNO ENAME      JOB       DEPTNO SAL
---------- ---------- ---------- ---------- ----------
         1 Anu        AP         1      10000
         2 Arjun      ASP        2      12000
         3 Megha      ASP        2      20000
         4 Karthik    AP         1      15000
```

Q1: The organization wants to display only the details of the employees those who are ASP. (Horizontal portioning)

Solution:

1. Create a view on emp table named managers
2. Use select from clause to do horizontal partioning

Ans:

```
SQL> create view empview as select * from emp where job='ASP';
View created.
SQL> select * from empview;
    EMPNO ENAME    JOB       DEPTNO   SAL
---------- -------------------- ---------- ---------- ----------
         2 Arjun                ASP              2      12000
         3 Gugan                ASP              2      20000
```

Q2: The organization wants to display only the details like empno, empname, deptno, deptname of the employees. (Vertical portioning)

Solution:

1. Create a view on emp table named general 2. Use select from clause to do vertical partioning

Ans:

```
SQL> create view empview1 as  select ename,sal from emp;
View created.
```

Q3: **Display all the views generated.**

Ans:

```
SQL> select * from tab;
TNAME                TABTYPE  CLUSTERID
------------------------------ ------- ----------
DEPT                  TABLE
EMP                   TABLE
EMPVIEW               VIEW
EMPVIEW1              VIEW
```

Q4: Execute the DML commands on the view created.

Ans:

```
SQL> select * from empview;
    EMPNO ENAME   JOB      DEPTNO    SAL
---------- -------------------- ---------- ---------- ----------
         2      Arjun         ASP        2           12000
         3      Megha          ASP       2           20000
```

Q5: Drop a view.

Ans: SQL> drop view empview1;

View dropped.

d) Result:

Thus the creation and manipulate various database objects of the Table using views was successfully executed.

QUESTIONS AND ANSWERS

1. What is a view?

A view is a logical table based on a table or another view. A view contains no data of its own but is like a window through which data from tables can be viewed or changed.

2. List any two advantages of view?

1. Hides data complexity.
2. Simplifies the usage by combining multiple tables into a single table.

Exercise Number: 8

Title of the Exercise : CONTROL STRUCTURE

Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To create PL/SQL programs to implement various types of control structure.

a) PL/SQL Syntax:

PL/SQL can also process data using flow of statements. The flow of control statements are classified into the following categories.

- Conditional control –Branching
- Iterative control – looping
- Sequential control - Selection

BRANCHING in PL/SQL:

Sequence of statements can be executed on satisfying certain condition. If statements are being used and different forms of if are:

1. Simple IF 2. If then else 3. Else if 4. Nested if

SELECTION IN PL/SQL (Sequential Controls)

1. Simple case 2. Searched case

ITERATIONS IN PL/SQL

Sequence of statements can be executed any number of times using loop construct. It is broadly classified into:

1.Simple Loop 2. For Loop 3. While Loop

SIMPLE IF:

Syntax:

```
IF condition THEN
statement1;
statement2;
END IF;
```

IF-THEN-ELSE STATEMENT:

Syntax:

```
IF condition THEN
statement1;
ELSE
statement2;
END IF;
```

ELSIF STATEMENTS:

Syntax:

```
IF condition1 THEN
statement1;
ELSIF condition2 THEN
statement2;
ELSIF condition3 THEN
statement3;
ELSE
```

statement;
END IF;

NESTED IF:

Syntax:

IF condition THEN
statement1;
ELSE
IF condition THEN
statement2;
ELSE
statement3;
END IF;
END IF;
ELSE
statement3;
END IF;

SELECTION IN PL/SQL (Sequential Controls)

SIMPLE CASE

Syntax:

CASE SELECTOR
WHEN Expr1 THEN statement1;
WHEN Expr2 THEN statement2;
:
ELSE
Statement n;
END CASE;

SEARCHED CASE:

Syntax:

CASE
WHEN searchcondition1 THEN statement1;
WHEN searchcondition2 THEN statement2;
::
ELSE
statementn;
END CASE;

ITERATIONS IN PL/SQL

SIMPLE LOOP

Syntax:

LOOP
statement1;
EXIT [WHEN Condition];
END LOOP;

Example:

```
Declare
A number:=10;
Begin
Loop
a := a+25;
exit when a=250;
end loop;
dbms_output.put_line(to_char(a));
end;
/
```

WHILE LOOP

Syntax

```
WHILE condition LOOP
statement1;
statement2;
END LOOP;
```

Example:

```
Declare
i number:=0;
j number:=0;
begin
while i<=100 Loop
j := j+i;
i := i+2;
end loop;
dbms_output.put_line(„the value of j is“ ||j);
end;
/
```

FOR LOOP

Syntax:

```
FOR counter IN [REVERSE]
LowerBound..UpperBound
LOOP
statement1;
statement2;
END LOOP;
```

Example:

```
Begin
For I in 1..2
Loop
Update emp set field = value where condition;
End loop;
End;
/
```

Q1: write a pl/sql program to swap two numbers

b) Procedure for doing the experiment:

Step no.	Details of the step
1	Declare three variables and read variables through a and b
2	Swap the values of a and b using temporary variables
3	Display the swapped results

c) Program:

```
SQL>edit swapping.sql
declare
a number(10);
b number(10);
c number(10);
begin
dbms_output.put_line('THE PREV VALUES OF A AND B WERE');
dbms_output.put_line(a);
dbms_output.put_line(b);
```

```
a:=&a;
b:=&b;
c:=a;
a:=b;
b:=c;
dbms_output.put_line('THE VALUES OF A AND B ARE');
dbms_output.put_line(a);
dbms_output.put_line(b);
end;
```

e)output:

```
SQL> @ swapping.sql
19 /
Enter value for a: 5
old 6: a:=&a;
new 6: a:=5;
Enter value for b: 3
old 7: b:=&b;
new 7: b:=3;
THE PREV VALUES OF A AND B WERE
53
THE VALUES OF A AND B ARE
35
PL/SQL procedure successfully completed.
```

Q2: Write a pl/sql program to find the largest of three numbers

c) Procedure for doing the experiment:

Step no.	Details of the step
1	Read three numbers through a, b & c
2	Find the biggest among three using nested if statement
3	Display the biggest no as result

d)Program:

```
SQL>set server output on;
SQL>edit biggest.sql
declare
a number;
b number;
c number;
begin
a:=&a;
b:=&b;
c:=&c;
if a>b then
if a>c then
dbms_output.put_line ('biggest is:' ||to_char(a));
else
dbms_output.put_line('biggest is :' ||to_char(c));
end if;
elsif b>c then
dbms_output.put_line('biggest is :' ||to_char(b));
else
dbms_output.put_line('biggest is :' ||to_char(c));
```

```
end if;
end;
```

e)output:

```
SQL>@biggest.sql
/
        Enter value for a: 5
        old 6: a:=&a;
        new 6: a:=5;
        Enter value for b: 5
        old 6: b:=&b;
        new 6: b:=8;
        Enter value for c: 8
        old 6: c:=&c;
        new 6: c:=4;
        biggest is : 8
```

Q3: write a pl/sql program to find the total and average of 6 subjects and display the grade
c) Procedure for doing the experiment:

Step no.	Details of the step
1	Read six numbers and calculate total and average
2	Find whether the student is pass or fail using if statement
3	Find the grade using nested elseif statement
4	Display the Grade, Percentage and Total of the student

d)Program:

SQL> edit grade.sql

```
declare
java number(10);
dbms number(10);
co number(10);
se number(10);
es number(10);
ppl number(10);
total number(10);
avgs number(10);
per number(10);
begin
dbms_output.put_line('ENTER THE MARKS');
java:=&java;
dbms:=&dbms;
co:=&co;
se:=&se;
es:=&es;
ppl:=&ppl;
total:=(java+dbms+co+se+es+ppl);
per:=(total/600)*100;
if java<50 or dbms<50 or co<50 or se<50 or es<50 or ppl<50 then
dbms_output.put_line('FAIL');
if per>75 then
dbms_output.put_line('GRADE A');
elsif per>65 and per<75 then
dbms_output.put_line('GRADE B');
elsif per>55 and per<65 then
```

```
dbms_output.put_line('GRADE C');
else
dbms_output.put_line('INVALID INPUT');
end if;
dbms_output.put_line('PERCENTAGE IS '||per);
dbms_output.put_line('TOTAL IS '||total);
end;
```

e)output:

```
SQL> @ grade.sql
31 /
Enter value for java: 80
old 12: java:=&java;
new 12: java:=80;
Enter value for dbms: 70
old 13: dbms:=&dbms;
new 13: dbms:=70;
Enter value for co: 89
old 14: co:=&co;
new 14: co:=89;
Enter value for se: 72
old 15: se:=&se;
new 15: se:=72;
Enter value for es: 76
old 16: es:=&es;
new 16: es:=76;
Enter value for ppl: 71
old 17: ppl:=&ppl;
new 17: ppl:=71;
GRADE A
PERCENTAGE IS 76
TOTAL IS 458
PL/SQL procedure successfully completed.
```

Q4: Write a pl/sql program to find the sum of digits in a given number

c) Procedure for doing the experiment:

Step no.	Details of the step
1	Read a number. Separate the digits using modular function
2	Sum the digits separated by mod function
3	Display the sum of digits

d)Program:

```
SQL>edit sumofdigits.sql
declare
a number;
d number:=0;
sum1 number:=0;
begin
a:=&a;
while a>0
loop
d:=mod(a,10);
sum1:=sum1+d;
```

```
a:=trunc(a/10);
end loop;
dbms_output.put_line('sum is'|| sum1);
end;
```

e)output:

```
SQL> @ sumofdigits.sql
        16 /
```

Q5: write a pl/sql program to display the number in reverse order

c)Procedure for doing the experiment:

Step no.	Details of the step
1	Read a number. Separate the digits using modular function
2	Reverse the digits separated by taking remainder from mod function
3	Display the reverse of the digits

d)Program:

```
SQL>edit reverse.sql
declare
a number;
rev number;
d number;
begin
a:=&a;
rev:=0;
while a>0
loop
d:=mod(a,10);
rev:=(rev*10)+d;
a:=trunc(a/10);
end loop;
dbms_output.put_line('no is'|| rev);
end;
```

e)output:

```
SQL> @ reverse.sql
16 /
Enter value for a: 536
        old 6: a:=&a;
        new 6: a:=536;
no is 635
PL/SQL procedure successfully completed.
```

Q6: Write a PL / SQL program to check whether the given number is prime or not

c) Procedure for doing the experiment:

Step no.	Details of the step
1	Read the number
2	Using mod function find the given number is prime or not
3	Display the result

d)Program:

```
SQL>edit prime.sql
declare
a number;        c number:=0;              i number;
begin
a:=&a;
for i in 1..a
loop
if mod(a,i)=0 then
c:=c+1;
end if;
end loop;
if c=2 then
dbms_output.put_line(a ||'is a prime number');
else
dbms_output.put_line(a ||'is not a prime number');
end if;
end;
```

e)output:

```
SQL> @ prime.sql
19 /
Enter value for a: 11
old 6: a:=&a;
new 6: a:=11;
11is a prime number
PL/SQL procedure successfully completed.
```

Q7: Write a PL/SQL program to find the factorial of a given number

c) Procedure for doing the experiment:

Step no.	Details of the step
1	Read a number for calculating factorial value.
2	Calculate the factorial of a given number using for loop
3	Display the factorial value of a given number.

d)Program:

```
SQL>edit fact.sql
declare
n number;f number:=1;
begin
n:=&n;
for i in 1..n
loop
f:=f*i;
end loop;
dbms_output.put_line('the factorial is'|| f);
end;
```

e)output:

```
SQL> @ fact.sql
12 /
Enter value for n: 5
old 5: n:=&n;
new 5: a:=5;
the factorial is 120
```

Q8: write a pl/sql code block to calculate the area of a circle for a value of radius varying from 3 to 7. Store the radius and the corresponding values of calculated area in an empty table named areas, consisting of two columns radius & area

c) Procedure for doing the experiment:

Step no.	Details of the step
1	Create a table named areas with radius and area
2	Initialize values to pi, radius and area
3	Calculate the area using while loop. Display the result.

d)Program:

```
SQL> create table areas(radius number(10),area number(6,2));
Table created.
PROGRAM
declare
pi constant number(4,2):=3.14;
radius number(5):=3; area number(6,2);
begin
while radius<7
loop
area:=pi*power(radius,2);
insert into areas values(radius,area);
radius:=radius+1;
end loop;
end;
```

e)output:

```
SQL> @ AREAOFCIRCLE.SQL
13 /
PL/SQL procedure successfully completed.
SQL> SELECT * FROM AREAS;
RADIUS AREA
---------- ----------
3 28.26
4 50.24
5 78.5
6 113.04
```

Q9: write a PL/SQL code block that will accept an account number from the user, check if the users balance is less than minimum balance, only then deduct rs.100/- from the balance. This process is fired on the acct table.

c) Procedure for doing the experiment:

Step no.	Details of the step
1	Develop a query to Create the table acct and insert values into them
2	Develop a PL/SQL program to read the account number.
3	Check the balance for the account no. check if the users balance is less than minimum balance, only then deduct rs.100/- from the balance
4	Update the balance changes into the acct table.

d)Program:

```
SQL> create table acct(name varchar2(10),cur_bal number(10),acctno number(6,2));
SQL> insert into stud values('&sname',&rollno,&marks);
SQL> select * from acct;
ACCTNO NAME CUR_BAL
---------- ---------- ----------
777 sirius 10000
765 john 1000
855 sam 500
353 peter 800
declare
mano number(5);
mcb number(6,2);
minibal constant number(7,2):=1000.00;
fine number(6,2):=100.00;
begin
mano:=&mano;
select cur_bal into mcb from acct where acctno=mano;
if mcb<minibal then
update acct set cur_bal=cur_bal-fine where acctno=mano;
end if;
end;
```

e)output:

```
SQL> @ BANKACC.sql
13 /
Enter value for mano: 855
old 7: mano:=&mano;
new 7: mano:=855;
        PL/SQL procedure successfully completed.
```

f)Result:

Thus the above creation of PL/SQL programs to implement various types of control structure was successfully executed.

QUESTIONS AND ANSWERS

1. What is meant by branching in PL/SQL:

Sequence of statements can be executed on satisfying certain condition. If statements are being used and different forms of if are:

1. Simple IF 2. If then else 3. Else if 4. Nested if

2. What are selection statements?

1. Switch case statement

3. Define iterations IN PL/SQL

Sequence of statements can be executed any number of times using loop construct.

4. Classify the iteration statements `in PL/SQL

It is broadly classified into:

1.Simple Loop
2. For Loop
3. While Loop

Exercise Number: 9

Title of the Exercise : PROCEDURE AND FUNCTION
Date of the Exercise :

OBJECTIVE (AIM) OF THE EXPERIMENT

To develop procedures and function for various operations.

a) PL/SQL syntax:

A procedure is a block that can take parameters (sometimes referred to as arguments) and be invoked.

Procedures promote reusability and maintainability. Once validated, they can be used in number of applications. If the definition changes, only the procedure are affected, this greatly simplifies maintenance.

Modularized program development:

- Group logically related statements within blocks.
- Nest sub-blocks inside larger blocks to build powerful programs.
- Break down a complex problem into a set of manageable well defined logical modules and implement the modules with blocks.

KEYWORDS AND THEIR PURPOSES

REPLACE: It recreates the procedure if it already exists.
PROCEDURE: It is the name of the procedure to be created.
ARGUMENT: It is the name of the argument to the procedure. Parenthesis can be omitted if no arguments are present.
IN: Specifies that a value for the argument must be specified when calling the procedure ie., used to pass values to a sub-program. This is the default parameter.
OUT: Specifies that the procedure passes a value for this argument back to it‟s calling environment after execution ie. used to return values to a caller of the sub-program.
INOUT: Specifies that a value for the argument must be specified when calling the procedure and that procedure passes a value for this argument back to it‟s calling environment after execution.
RETURN: It is the data type of the function‟s return value because every function must return a value, this clause is required.

PROCEDURES

Syntax :

```
create or replace procedure <procedure name> (argument {in,out,inout} datatype ) {is,as}
variable declaration;
constant declaration;
begin
PL/SQL subprogram body;
exception
exception PL/SQL block;
end;
```

FUNCTIONS

Syntax:

```
create or replace function <function name> (argument in datatype,……) return datatype {is,as}
variable  declaration;
constant declaration;
begin
PL/SQL subprogram body;
exception
exception PL/SQL block;
end;
```

Tables used:

```
SQL> select * from ititems;
ITEMID  ACTUALPRICE     ORDID    PRODID
---------  -----------  --------  ---------
     101        2000       500       201
     102        3000      1600       202
     103        4000       600       202
```

PROGRAM FOR GENERAL PROCEDURE – SELECTED RECORD'S PRICE IS INCREMENTED BY 500 , EXECUTING THE PROCEDURE CREATED AND DISPLAYING THE UPDATED TABLE

```
SQL> create procedure itsum(identity number, total number) is price number;
  2  null_price exception;
  3  begin
  4  select actualprice into price from ititems where itemid=identity;
  5  if price is null then
  6  raise null_price;
  7  else
  8  update ititems set actualprice=actualprice+total where itemid=identity;
  9  end if;
 10  exception
 11  when null_price then
 12  dbms_output.put_line('price is null');
 13  end;
 14  /
Procedure created.

SQL> exec itsum(101, 500);
PL/SQL procedure successfully completed.

SQL> select * from ititems;
 ITEMID   ACTUALPRICE     ORDID    PRODID
---------  -----------  --------  ---------
     101        2500       500       201
     102        3000      1600       202
     103        4000       600       202
```

PROCEDURE FOR _IN' PARAMETER – CREATION, EXECUTION

```
SQL> set serveroutput on;
SQL> create procedure yyy (a IN number) is price number;
  2  begin
  3  select actualprice into price from ititems where itemid=a;
```

```
  4  dbms_output.put_line('Actual price is ' || price);
  5  if price is null then
  6  dbms_output.put_line('price is null');
  7  end if;
  8  end;
  9  /
Procedure created.

SQL> exec yyy(103);
Actual price is 4000
PL/SQL procedure successfully completed.
```

PROCEDURE FOR _OUT‘ PARAMETER – CREATION, EXECUTION

```
SQL> set serveroutput on;
SQL> create procedure zzz (a in number, b out number) is identity number;
  2  begin
  3  select ordid into identity from ititems where itemid=a;
  4  if identity<1000 then
  5   b:=100;
  6  end if;
  7  end;
  8  /
Procedure created.
SQL> declare
  2  a number;
  3  b number;
  4  begin
  5  zzz(101,b);
  6  dbms_output.put_line('The value of b is '|| b);
  7  end;
  8  /
The value of b is 100
PL/SQL procedure successfully completed.
```

PROCEDURE FOR _INOUT‘ PARAMETER – CREATION, EXECUTION

```
SQL> create procedure itit ( a in out number) is
  2  begin
  3  a:=a+1;
  4  end;
  5  /
  Procedure created.

SQL> declare
  2  a number:=7;
  3  begin
  4  itit(a);
  5  dbms_output.put_line(„The updated value is „||a);
  6  end;
  7  /
The updated value is 8
PL/SQL procedure successfully completed.
```

Tables used:

```
SQL>select * from ittrain;
     TNO       TFARE
  ---------    ------------
    1001       550
    1002        600
```

PROGRAM FOR FUNCTION AND IT‘S EXECUTION

```
SQL> create function trainfn (trainnumber number) return number is
  2  trainfunction ittrain.tfare % type;
  3  begin
  4  select tfare into trainfunction from ittrain where tno=trainnumber;
  5  return(trainfunction);
  6  end;
  7  /
Function created.

SQL> declare
  2  total number;
  3  begin
  4  total:=trainfn (1001);
  5  dbms_output.put_line('Train fare is Rs. '||total);
  6  end;
  7  /
Train fare is Rs.550
PL/SQL procedure successfully completed.
```

FACTORIAL OF A NUMBER USING FUNCTION — PROGRAM AND EXECUTION

```
  SQL>  create function itfact (a number) return number is
  2   fact number:=1;
  3   b number;
  4   begin
  5   b:=a;
  6   while b>0
  7   loop
  8   fact:=fact*b;
  9   b:=b-1;
 10    end loop;
 11  return(fact);
 12  end;
 13  /
Function created.

SQL> declare
  2  a number:=7;
  3  f number(10);
  4  begin
  5  f:=itfact(a);
  6  dbms_output.put_line(„The factorial of the given number is‟‟||f);
  7 end;
  8  /

The factorial of the given number is 5040
```

Q1: Write a procedure to calculate total for the all the students and pass regno, mark1, & mark2 as arguments.

b) Procedure for doing the experiment:

Step no.	Details of the step
1	Develop a query to create a table named itstudent2 and insert values into them
2	Develop a procedure p1 with regno, mark1, & mark2 as arguments.
3	Calculate the total and update the total value into the itstudent2 table

d)Program:

```
SQL>  create table itstudent2(regno number(3),name varchar(9),mark1 number(3),mark2
number(3));
Table created.
SQL> insert into itstudent2
2  values(&a,'&b',&c,&d);
Enter value for a: 110
Enter value for b: arun
Enter value for c: 99           Enter value for d: 100
old   2: values(&a,'&b',&c,&d)
new   2: values(110,'arun',99,100)
1 row created.
SQL> /
Enter value for a: 112          Enter value for b: siva         Enter value for c: 99     Enter value
for d: 90
old   2: values(&a,'&b',&c,&d)
new   2: values(112,'siva',99,90)
1 row created.
SQL> select * from itstudent2;
    REGNO NAME          MARK1      MARK2
      110 arun            99        100
      112 siva            99        90
SQL> alter table itstudent2 add(total number(5));              Table altered.
SQL> select * from itstudent2;
REGNO NAME    MARK1 MARK2               TOTAL
      110   arun          99        100
      112   siva          99        90
SQL> create or replace procedure p1(sno number,mark1 number,mark2 number) is
  2  tot number(5);
  3  begin
  4  tot:=mark1+mark2;
  5  update itstudent2 set total=tot where regno=sno;
  6  end;
  7  /
Procedure created.
SQL> declare
  2  cursor c1 is select * from itstudent2;
  3  rec itstudent2 % rowtype;
  4  begin
  5  open c1;
  6  loop
  7  fetch c1 into rec;
```

```
 8  exit when c1%notfound;
 9  p1(rec.regno,rec.mark1,rec.mark2);
10  end loop;
11  close c1;
12  end;
13  /
```

PL/SQL procedure successfully completed.

e)Output:

```
SQL> select * from itstudent2;
REGNO NAME    MARK1  MARK2 TOTAL
--------- --------- ---------- ---------- ----------
      110  arun             99      100       199
      112 siva              99       90       189
```

Q2: Write a PL/SQL procedure called MULTI_TABLE that takes two numbers as parameter and displays the multiplication of the first parameter till the second parameter.

Ans.

//p2.sql

```
create or replace procedure multi_table (a number, b number) as
mul number;
begin
for i in 1. .b
loop
mul : = a * i;
dbms_output.put_line (a || „*‟ || i || „=‟ || mul);
end loop;
end;
```

//pq2.sql

```
declare
a number;  b number;
begin
a:=&a;              b:=&b;              multi_table(a,b);
end;
```

e)Output:

```
SQL> @p2.sql;
  Procedure created.
SQL> @pq2.sql;
Enter value for a: 4
old   5: a:=&a;             new   5: a:=4;
Enter value for b: 3
old   6: b:=&b;             new   6: b:=3;
4*1=4
4*2=8
4*3=12
```

Q3: Consider the EMPLOYEE (EMPNO, SALARY, ENAME) Table.
Write a procedure raise_sal which increases the salary of an employee. It accepts an employee number and salary increase amount. It uses the employee number to find the current salary from the EMPLOYEE table and update the salary.

Ans:

//p3.sql

```
create or replace procedure raise_sal( mempno employee . empno % type, msal_percent
number ) as
begin
update employee set salary = salary + salary*msal_percent /100 where empno = mempno;
end;
/
```

//pq3.sql

```
declare
 cursor c1 is select * from emp;
  rec emp % rowtype;
  begin
  open c1;
  loop
  fetch c1 into rec;
  exit when c1%notfound;
  raisal(rec.empno,10);
  end loop;
  close c1;
  end;
  /
```

e)Output:

```
SQL> @p3.sql;
  Procedure created.
SQL> select * from emp;
    EMPNO ENAME    JOB             DEPTNO       SAL
---------- -------------------- ------------- ---------- ----------
         1 Anu                  AP                 1       10000
         2 Arjun                ASP                2       15000
         3 Megha                ASP                1       15000
         4 Karthik              Prof               2       30000
         5 Ahalya               AP                 1       10000
SQL> @pq3.sql;
PL/SQL procedure successfully completed.
SQL> select * from emp;
    EMPNO ENAME   JOB         DEPTNO       SAL
---------- -------------------- ------------- ---------- ----------
         1 Anu                  AP                 1      11000
         2 Arjun                ASP                2      16500
         3 Megha               ASP                 1     16500
         4 Karthik              Prof               2     33000
         5 Ahalya              AP                  1      11000
```

Q4: Write a PL/SQL function CheckDiv that takes two numbers as arguments and returns the values 1 if the first argument passed to it is divisible by the second argument, else will return the value 0;

Ans:

//p4.sql

```
create or replace function checkdiv (n1 number, n2 number) return number as res
number;
begin
if mod (n1, n2) = 0 then
res := 1;
else
res:= 0;
end if;
return res;
end;
/
```

//pq4.sql

```
declare
a number;
b number;
```

```
begin
a:=&a;          b:=&b;
dbms_output.put_line(„result=‟||checkdiv(a,b));
end;
/
```

e)Output:

```
SQL> @p4.sql;
        Function created.
SQL> @pq4.sql;
        Enter value for a: 4
        old   5: a:=&a;          new   5: a:=4;
        Enter value for b: 2
        old   6: b:=&b;          new   6: b:=2;
        result=1
```

Q5: Write a PL/SQL function called POW that takes two numbers as argument and return the value of the first number raised to the power of the second .

Ans:

//p5.sql

```
create or replace function pow (n1 number, n2 number) return number as
res number;
begin
select power ( n1, n2) into res from dual;          return res;
end;
```

or

```
create or replace function pow (n1 number, n2 number) return number as
res number : =1;
begin
for res in 1..n2
loop
res : = n1 * res;
end loop;
return res;
end;
```

//pq5.sql

```
declare
a number;
b number;
begin
a:=&a;          b:=&b;
dbms_output.put_line('power(n1,n2)='||pow(a,b));
end;
/
```

e)Output:

```
SQL> @p5.sql;
        Function created.
SQL> @ pq5.sql;
        Enter value for a: 2
        old   5: a:=&a;
        new   5: a:=2;
        Enter value for b: 3
        old   6: b:=&b;
        new   6: b:=3;
        power(n1,n2)=8
```

Q6: Write a PL/SQL function ODDEVEN to return value TRUE if the number passed to it is EVEN else will return FALSE.

Ans:

//p6.sql

```
create or replace function oddeven (n number) return boolean as
begin
if mod (n, 2) = 0 then  return true;
else
return false;
end if;
end;
/
```

//pq6.sql

```
declare
a number;  b boolean;
begin
a:=&a;   b:=oddeven(a);
if b then
dbms_output.put_line('The given number is Even');
else
dbms_output.put_line('The given number is Odd');
end if;
end;
/
```

e)Output:

```
SQL> @p6.sql;
Function created.
SQL> @pq6.sql;
Enter value for a: 5
old   5: a:=&a;   new   5: a:=5;

The given number is Odd
```

f)Result:

Thus the procedures and function for various operations was developed and executed successfully.

QUESTIONS AND ANSWERS

1. What is procedure? Write its advantages.

A procedure is a block that can take parameters (sometimes referred to as arguments) and be invoked. **Advantages:**

Procedures promote reusability and maintainability.

They can be used in number of applications.

If the definition changes, only the procedure are affected, this greatly simplifies maintenance.

2. List the three types of argument passed in to the procedure

IN: Specifies that a value for the argument must be specified when calling the procedure

OUT: Specifies that the procedure passes a value for this argument back to it‟s calling environment after execution ie. used to return values to a caller of the sub-program.

INOUT: Specifies that a value for the argument must be specified when calling the procedure and that procedure passes a value for this argument back to it‟s cal ling environment after execution.

3. Is the function return value?

Yes, function‟s return value because every funct ion must return a value, this clause is required.
